

Trusted Device Management & 'Remember This Device'

Blossom Banking's 'Remember This Device' feature lets members skip MFA on devices they use regularly, without reducing security. This document explains how trusted devices work, how to manage them, and what to do when they stop being recognized.

1. How Trusted Devices Work

When you complete a successful MFA login, you may check 'Remember this device' before submitting your code. Blossom stores an encrypted device fingerprint in a persistent browser cookie. On future logins from the same browser/device, the system recognizes the fingerprint and skips MFA.

- Trust is bound to a specific browser on a specific device (not the device OS-wide).
- Clearing browser cookies removes the trusted device record locally.
- Trusted status expires automatically after 90 days of inactivity.
- Members can manage (view and revoke) all trusted devices from the Security Settings.

Note: Trusting a device on a shared, public, or work-managed computer is not recommended. Trust should only be granted to personal devices you control.

2. Enabling 'Remember This Device'

During login:

- Enter your username and password correctly.
- You are prompted for your MFA code.
- Check the box labeled 'Trust this device for 90 days' before submitting.
- Enter your MFA code and click 'Verify'.
- The device is now trusted for 90 days.

From Security Settings:

- Log in normally and go to Settings > Security > Trusted Devices.
- Click 'Add This Device' to trust your current browser/device.
- You must re-enter your MFA code to confirm.

3. Trusted Device Expiry & Renewal

Trusted device records expire after 90 days from the last successful login on that device. When a trusted device expires, MFA is required on the next login. Checking 'Remember this device' again during that login renews the 90-day period.

- Expiry: 90 days from the last login, not 90 days from when trust was granted.
- Logging in at least once every 90 days keeps the device permanently trusted.
- If trust has already expired, MFA is required once to renew it.
- There is no way to extend trust without completing an MFA login.

4. Managing Trusted Devices

You can view and revoke trusted devices at any time from your account settings. Each device entry shows the browser, operating system, approximate location, and last-used date.

To revoke a trusted device:

- Go to Settings > Security > Trusted Devices.
- Find the device you want to remove and click 'Revoke'.
- Confirm the revocation. MFA will be required on the next login from that device.
- To revoke all devices at once, click 'Revoke All Trusted Devices'.

Important: If you see a trusted device you do not recognize, revoke it immediately and change your password. Contact Member Support if you suspect unauthorized access.

5. Why a Trusted Device Stopped Being Recognized

Members sometimes report that their device is no longer recognized after it was previously trusted. Common causes:

- Browser cookies were cleared manually or by a browser update.
- Private/incognito mode was used (cookies are not persisted).
- Browser was updated and changed its fingerprint significantly.
- 90-day trust period expired.
- Member or staff revoked the device from Security Settings.
- Suspicious activity caused an automatic revocation of all trusted devices.
- The member logged in from a different browser on the same device.

What to do:

Complete MFA once on the affected device and check 'Trust this device' to re-establish trust. If trust keeps dropping unexpectedly, check browser settings for cookie retention or contact Member Support.

6. Staff Actions on Trusted Devices

Support agents and branch staff can view and revoke a member's trusted devices via the Admin Portal, but cannot add trusted devices on behalf of a member.

- Admin Portal > Member Management > select member > Security tab > Trusted Devices.
- View list of trusted devices with browser, location, and last-used date.
- Click 'Revoke' next to individual devices or 'Revoke All' to clear all.
- All revocations are logged in the member's audit trail.
